Damian Zuniga
Data Structures & Algorithms
13/11/26

My experience with this assignment was *turbulent* to put it mildly. There were points of development that went smooth as butter, and others that made me want to slam my face into my desk, at home and here in the facility. But all in all, we got through it and now I get to write this report and wind down, so hooray for that smile.

I'd say as far as the most challenging week, week 3 takes the cake. That whole merge sort song and dance was pretty frustrating, and not even the fact that I didn't understand it, I *do*, the frustrating part was not being able to translate that into code and understanding the code itself. I pretty much ripped the pseudo code word-for-word, bar-for-bar, and frankensteined it to work with *DateTime*, and that did get me through the assessment, but I wish I had a more intimate understanding of what I was doing as opposed to copy-pasting from the slides.

Moving on from week 3, let's talk about week 4! In terms of the algorithm I chose for the task, for the most part I just stuck with what was mentioned in the lecture. I took in the sorted array I had created from week 3, and had my binary search function called twice, once to find the index of the lower range, and the other to find the index of the upper range. I then added all the values in between those indexes into an array to get a list of employees between a specified time frame. The most headache-inducing part of this assignment was trying to get this task to be generic, which I unfortunately was not able to do. Thankfully the binary search tree task we implemented for our final week is generic, bless.

In terms of the suspects I found from my binary search tree, we got [Jasper Wellington, Alfred Pugsley, Nem Wellington, Helena Blackwood]. In terms of whodunnit, my money is on Pugsley, just off of sheer vibes. Whether that's true or not, I couldn't tell you, what I can tell you is that for the most part, I found these assignments to be overall manageable, but good god that mergesort week was something alright, not in terms of implementing it but *understanding* the logic. Overall, I think I did good :3

P.S. Olek just gave me the intel to make Week 4's sort more generic, apparently you just have to return median instead or something like that. That's neat, but unfortunately for all parties involved, I am lazy ¯_(ツ)_/¯ .
